Accomplishments

Please tell us about a time you most successfully hacked some (non-computer) system to your advantage.

I was a production engineering student in Mumbai. No CS degree, no European contacts, no research background. I read a paper from Prof. Burkhard Stiller's lab at the University of Zurich, wrote him a cold email, and a few weeks later I had a fully funded research internship at one of the best distributed systems labs in the world. First person from my university to ever do this.

That same period in Zurich, I read about a hyperloop project being set up in India, traced it back to a Swiss company, and cold emailed the CEO. Twenty minutes into the call he CC'd his tech lead with "we need exactly this kind of person on our team." I had zero hyperloop engineering background. I had a clear point of view and the nerve to send the email.

I have operated this way my whole life. In college I got rejected from almost every club and community I tried to join. So I showed up as a volunteer with no title, worked through the night on whatever needed doing, convinced senior industry figures to come speak at our institute through direct personal outreach, and a year later was the student body's first-choice candidate for secretary, the highest student position overseeing all clubs. I never sat for the interviews. I had already decided to go to Zurich and build something real.

Please tell us in one or two sentences about the most impressive thing other than this startup that you have built or achieved.

As a production engineering undergraduate with no CS degree and no European connections, I landed a fully funded research internship at the Communication Systems Group, University of Zurich, through a single cold email, the first person from my university to do so. I also hold an active internship and PhD offer from Inria, France (one of Europe's top CS research institutions)

Tell us about things you've built before. For example apps you've built, websites, open source contributions. Include URLs if possible.

Layer36: a cross-platform WebAssembly runtime. The idea: write one app, run it on Windows, Linux, macOS, Android, iOS, ChromeOS, and the web through one common Layer36 runtime layer instead of maintaining six separate codebases. Built in Rust with a working CLI (run, version, doctor), a Wasmtime-based runtime, CI that runs the same .wasm binary across all three desktop platforms, a prerelease at v0.1.0-rc1, a full threat model, benchmarks, architecture decision records, and public documentation.
<https://incyashraj.github.io/layer6x6/introduction.html>

Karana OS: an intent-driven OS for IoT devices. Custom kernel, memory manager, scheduler, and hardware abstraction layer written in Rust, C, and Assembly. The AI task layer chains device capabilities at runtime based on inferred user goals rather than explicit commands. 200,000+ lines.
<https://github.com/incyashraj/karana-os>

Bouclier: open-source ERC-7579 permission layer for AI agents on EVM chains. Five deployed and source-verified contracts, 100 Solidity tests across unit, invariant, and integration suites, Foundry invariant fuzzing at 128K calls, Certora specs written, SDKs in TypeScript, Python, LangChain, ELIZA, and Coinbase AgentKit, a FastAPI multi-tenant backend, and a 16-page Next.js dashboard hosted on IPFS at bouclier.eth. Live on Base Sepolia.
<https://github.com/incyashraj/bouclier>
<https://bouclier.eth.limo>

Entangled Privacy Lattice (EPL, later OnBoard): multi-chain decentralised social network with post-quantum lattice encryption and ZK-ML inference where models never access plaintext user data and all trust assumptions are on-chain.

SCIN (Scientific Carbon Intelligence Network): IoT sensor data runs through an AI verification engine before validated carbon credits are minted on-chain. Under 2% false-positive rate on anomaly detection.
<https://github.com/incyashraj/SCIN-Scientific-Carbon-Intelligence-Network>

DeFi Yield Farming Protocol: AMM smart contract with three dynamic fee tiers and LP incentive mechanisms, Chainlink oracle integration, and under 0.5% slippage protection. Audited with Slither and Foundry fuzz testing (10,000+ runs, 0 high-severity findings).
<https://github.com/incyashraj/DeFi-Protocol>

Suitcase: a web app for reading PDF books with built-in AI for chapter summaries, context recall, and author notes, Goodreads review integration, and a Layer 3 token reward system for the most active readers.
<https://github.com/incyashraj/suitcaseApp>

Before any of this I was 15 writing my first programs and making games. At 16 I built a full game without any formal training and founded a game development club at my school, ran workshops, and got a large group of students building their first games for the first time. That was the first thing I ever organised from scratch, and it worked.

List any competitions/awards you have won, or papers you've published.

Thesis from UZH on Distributed Ledger Based Tech is being refined to be submitted soon.

You're being asked the following questions because you're 25 or under.

List any relevant or impressive test scores.

Bachelor's from VJTI, which selects a few hundred students from over 100,000 applicants through a centralised state exam.

List any entrepreneurship programs, clubs, or hacker houses you have participated in or are currently participating in.

Invited attendee, MIT AI Agents and Nanda Summit, April 2025 (invite-only event with senior researchers, founders, and policymakers in AI). Now exploring research direction in blockchain+AI domain with Prof. Ramesh Raskar, MIT.

Active research discussions with Prof. Roxana Radu, University of Oxford, on cryptocurrency regulation and digital governance frameworks.

PR and Sponsorship Head, Nexus: VJTI's national-level technical festival with 20,000+ attendees. Handled all corporate outreach, negotiated sponsorship deals, and personally convinced senior industry figures to attend as speakers.

Joint Director of Programs, IEOM Society chapter, VJTI: Planned and ran academic programmes, speaker events, and logistics for the chapter across multiple semesters.

Community service organiser, Mumbai: led city-wide events for underserved communities engaging 1400+ participants across partner organisations. This started well before college, organising events for people who needed them, and continued through university.

Game Development Club, school founded it, ran workshops, brought in students who had never touched a game engine before, and built something that lasted.

No formal accelerator or hacker house participation yet.
